**Phytoplankton concentration ( $Fo$ ) (A) and photosynthetical activity ( $Fv/Fm$ )(B), as well as water temperature (C) in the cross section of Issik-Kul Lake (Tamga-Grigor'evka).** Data were obtained with using submersible fluorometer in July 1999.

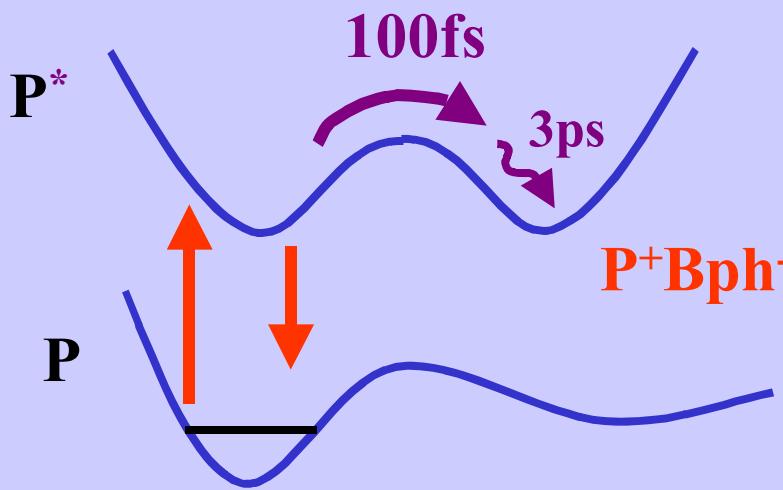

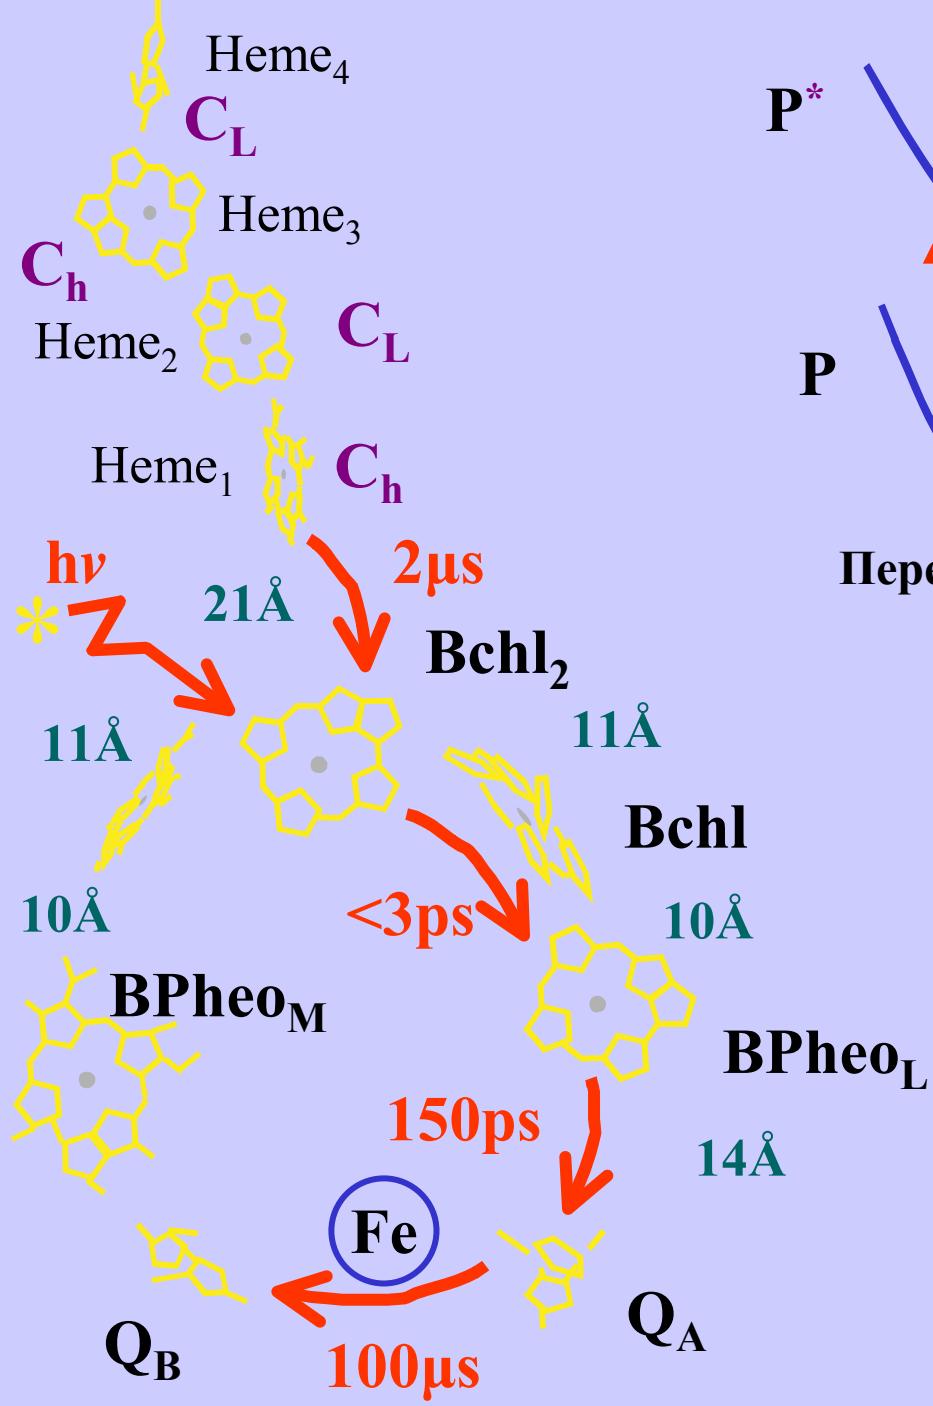

Investigation of the vertical distribution of phytoplankton in oligotrophic Issyk-Kul Lake showed a complex structure of phytoplankton, which is due to pronounced water stratification. The lowest values of the abundance and photosynthetic activity were found in the upper layer under conditions of a high solar irradiation and low content of mineral nutrients. High abundance and high activity of algal cells were found in the deep layers of the photic zone indicating the presence of active algae, adapted to low light condition.

**РИСУНОК 1 |** Спектры поглощения и флуоресценции сферических CdSe/ZnS нанокристаллов структуры ядро/оболочка. Диаметр CdSe ядер: 2.5 нм (зеленые), 3.3 нм (желтые) и 4.8 нм (красные). На вставке — флуоресценция CdSe/ZnS нанокристаллов разных размеров. Для всех нанокристаллов использован один источник возбуждения — ртутная лампа.

**ТАБЛИЦА 1 |** Спектральные свойства материалов квантовых точек [3, 20, 55–59]

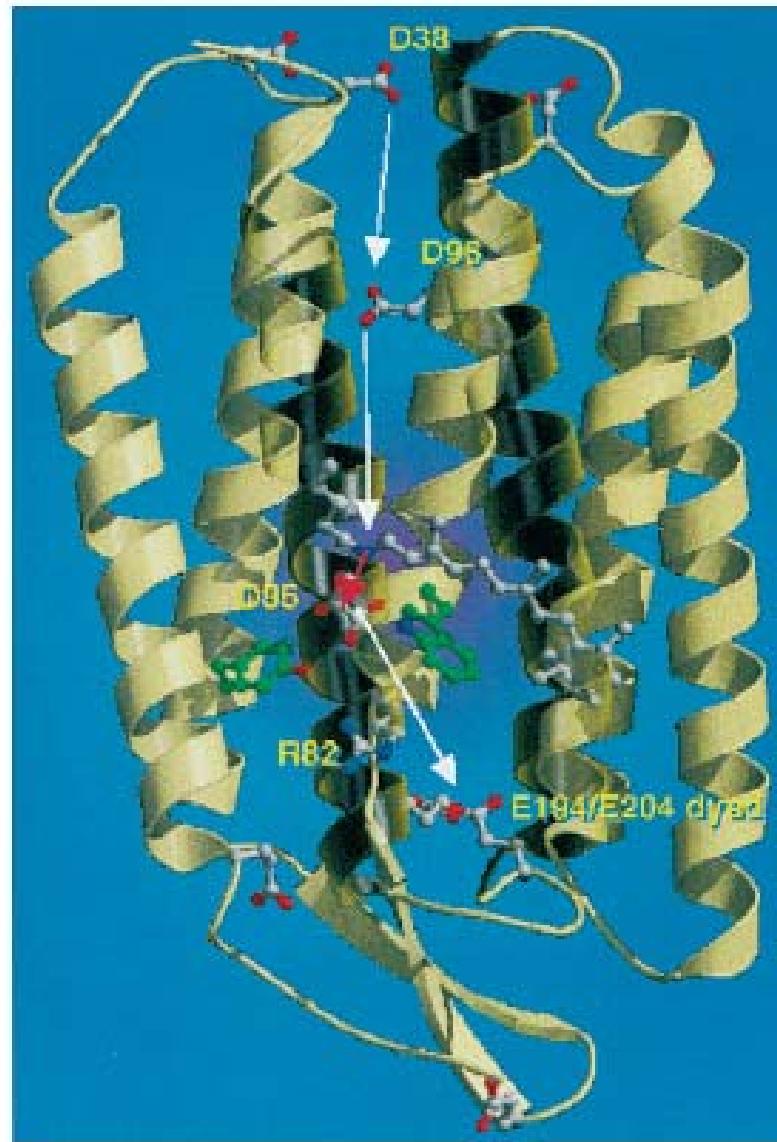

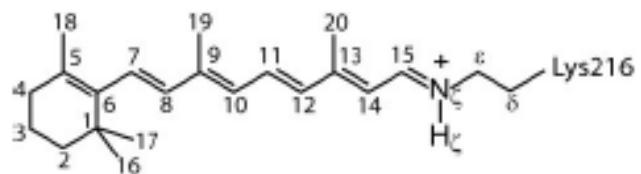

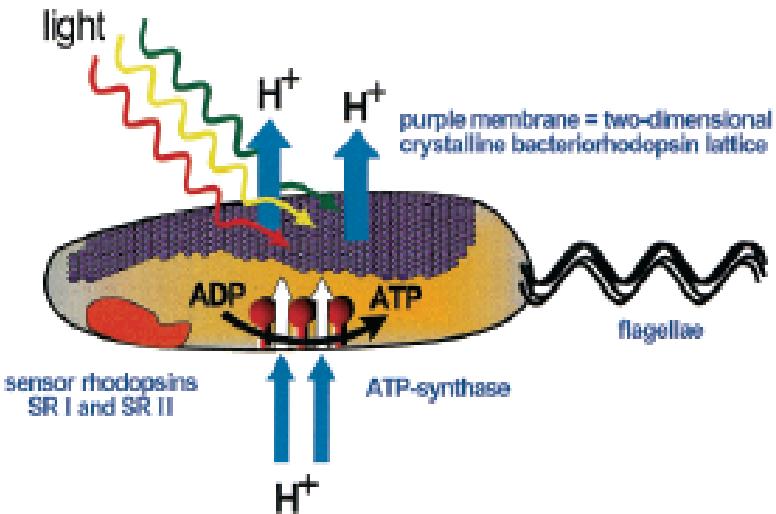

Материал нанокристалла	Оптический диапазон эмиссии, нм
ZnS	300–380
CdS	380–460
ZnSe	360–500
CdSe	480–660
CdSe/Te CdHgTe сплав	550–1000
CdTe	600–1000
CdHgTe/ZnS	630–860
InP	650–750
PbS	700–1600
InAs	830–1350
PbSe/Te	1000–2500

# Пространственное расположение комплексов в мембране

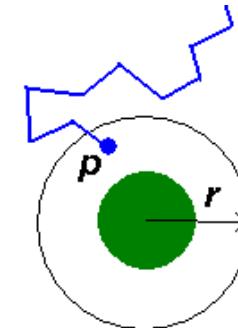

Scene of the direct model

# Brownian motion of the mobile carrier

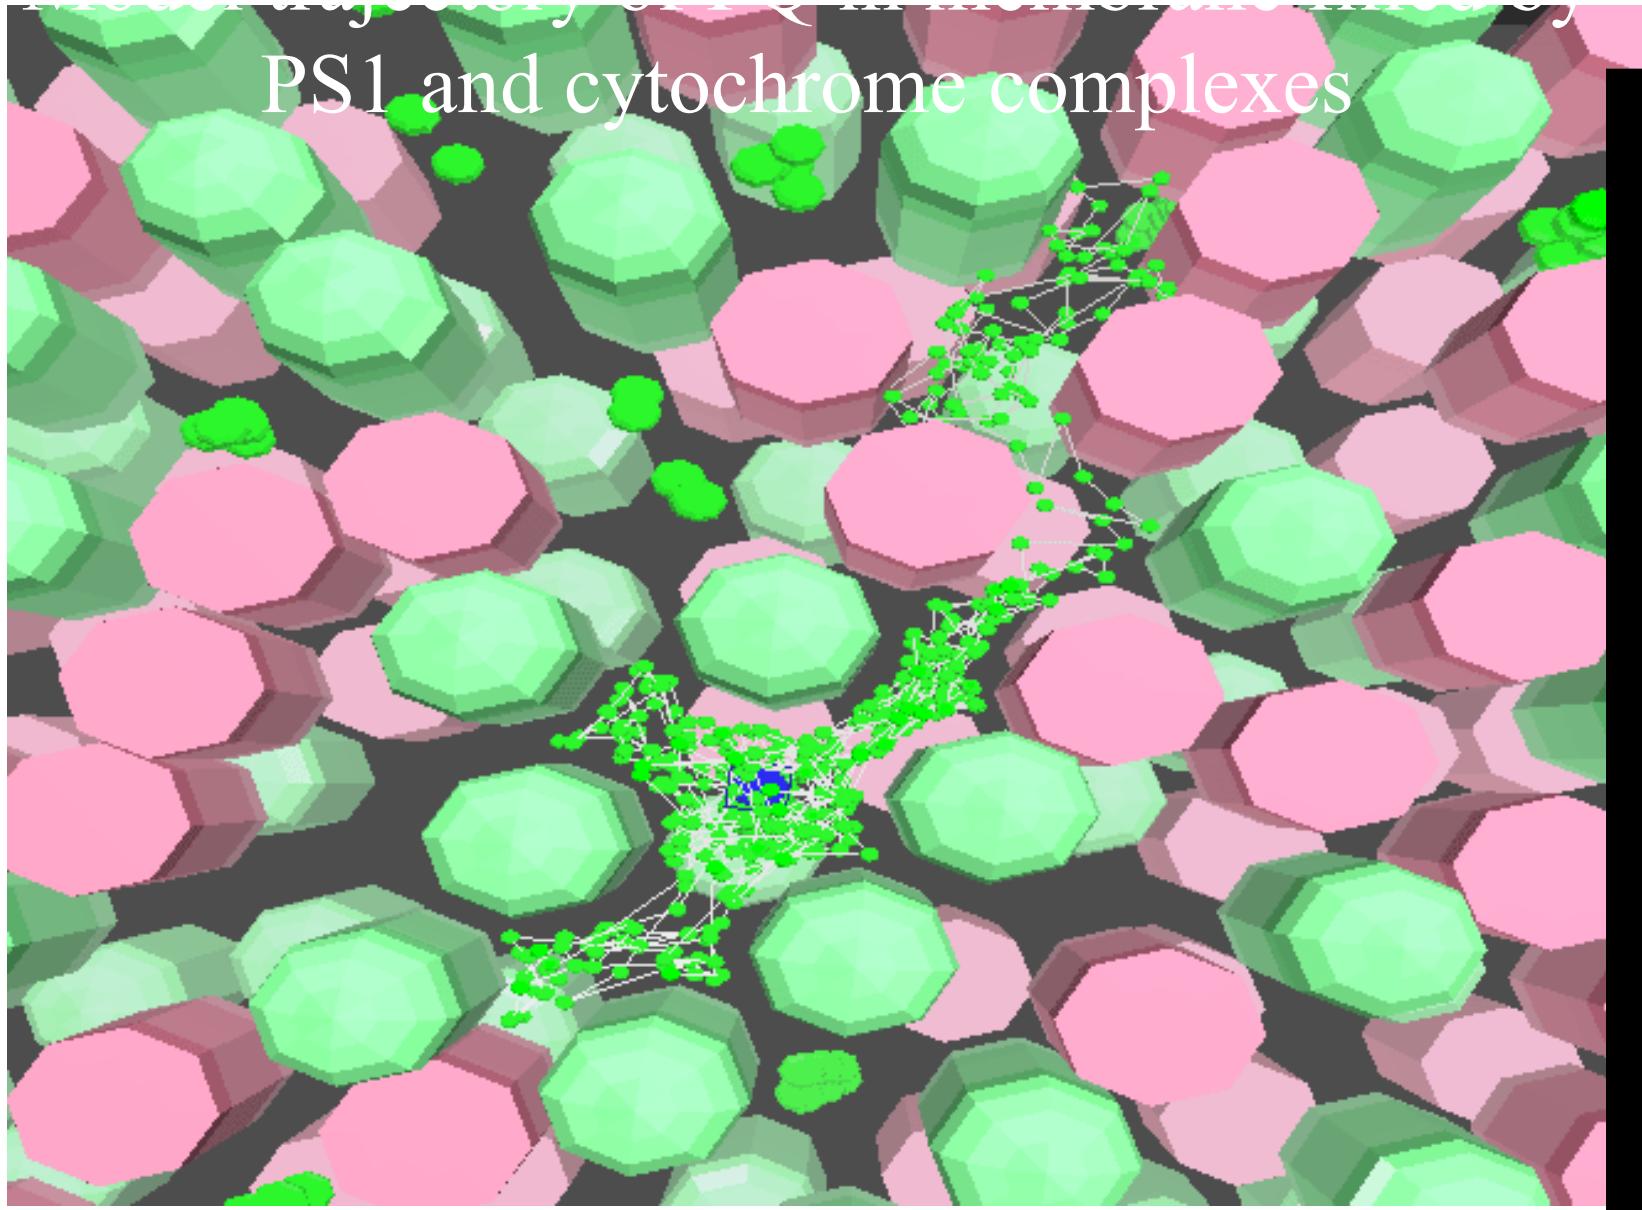

- Langevin Equation:

$$\xi \frac{dx}{dt} = f(t)$$

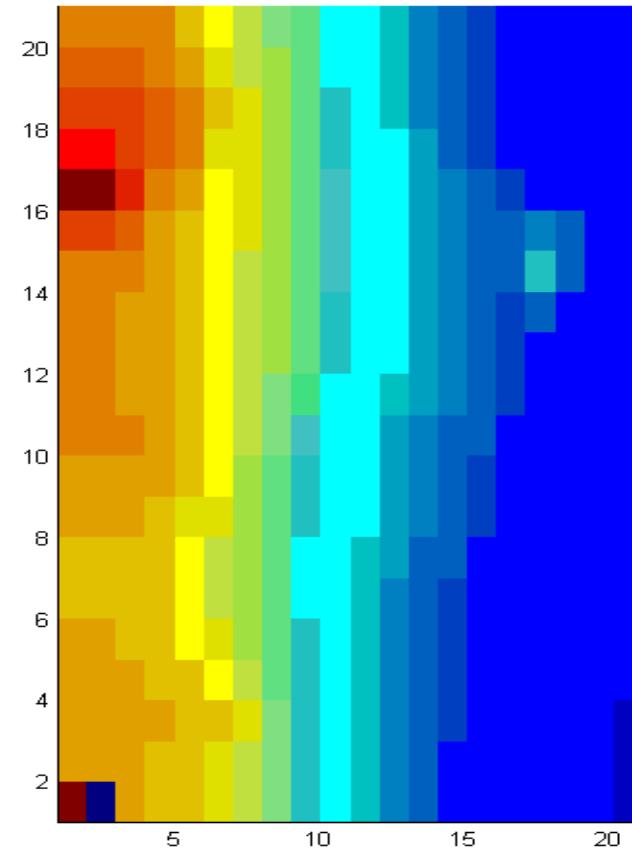

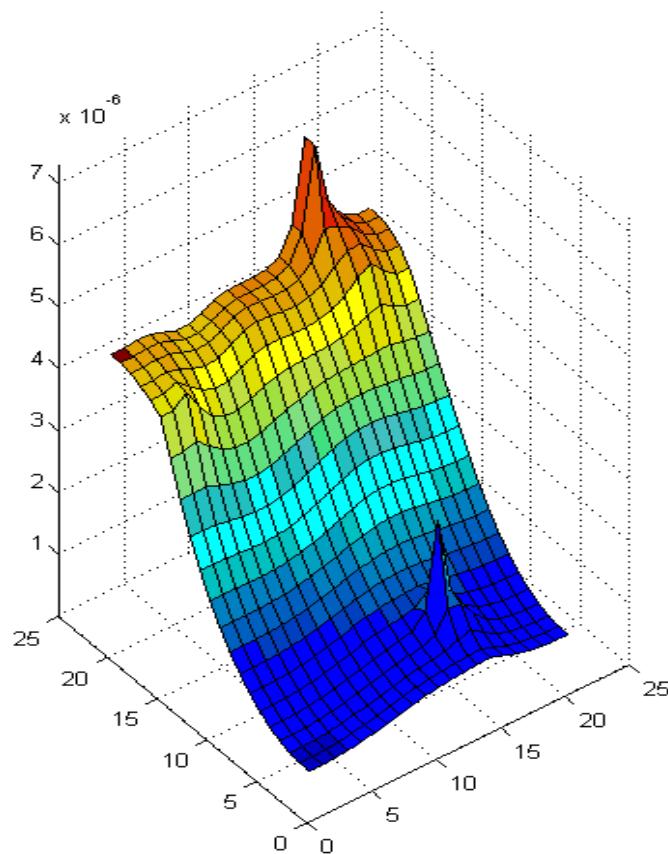

- $f(t)$  – casual force, distributed by Gauss
- average value - zero
- dispersion  $2kT\xi$
- $k$  – Boltzmann constant,  $T$  – temperature,  
 $\xi$  – friction coefficient of the media

# PS1 and cytochrome complexes

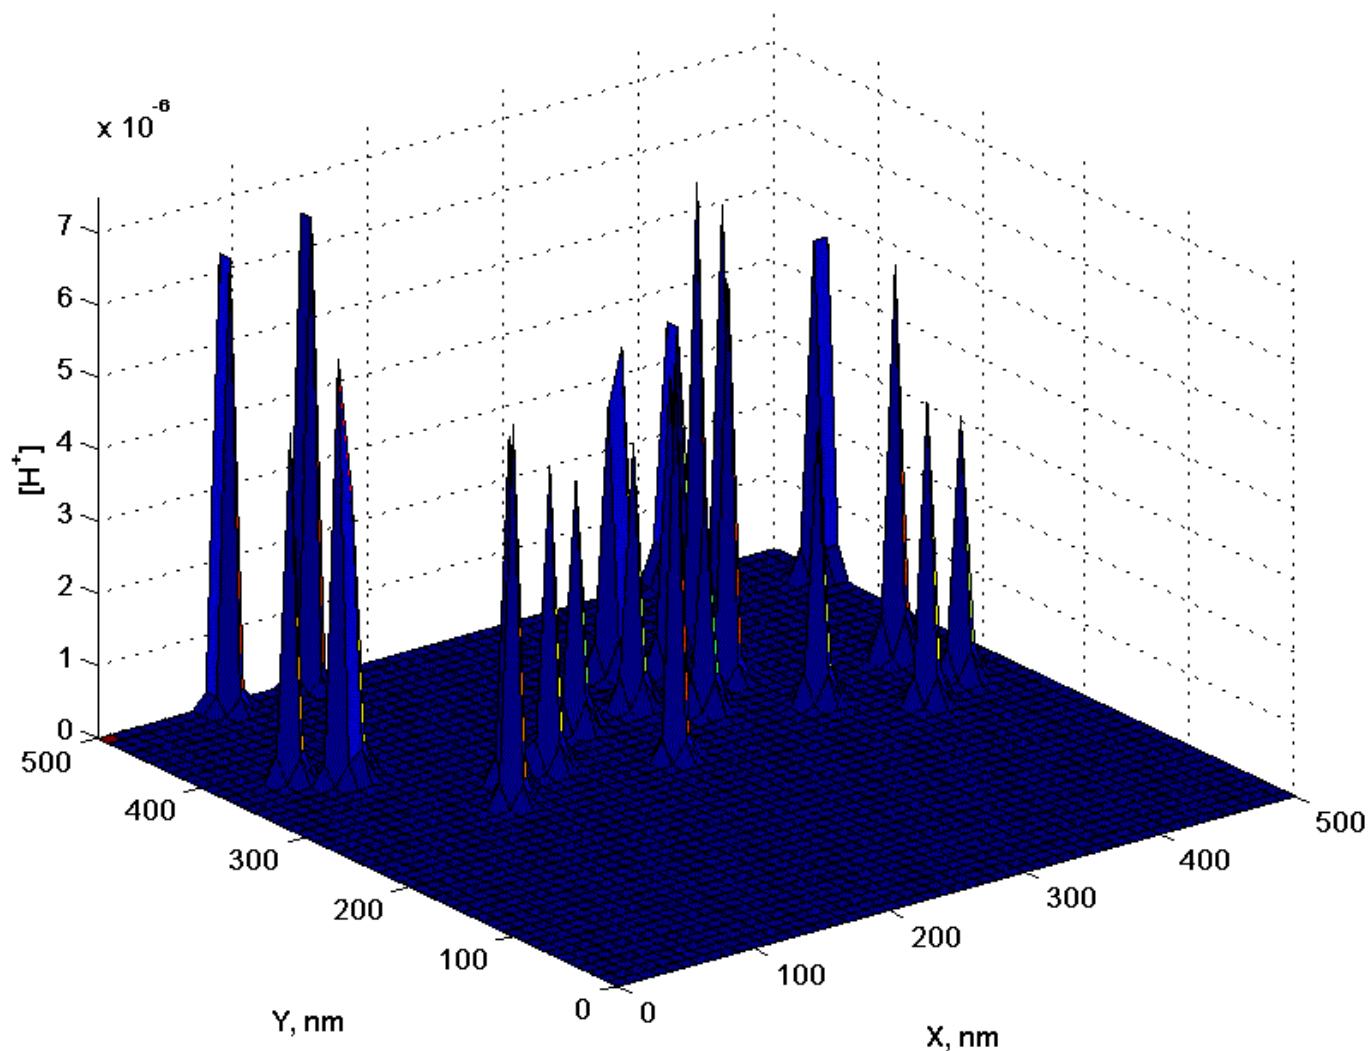

# Накопление протонов

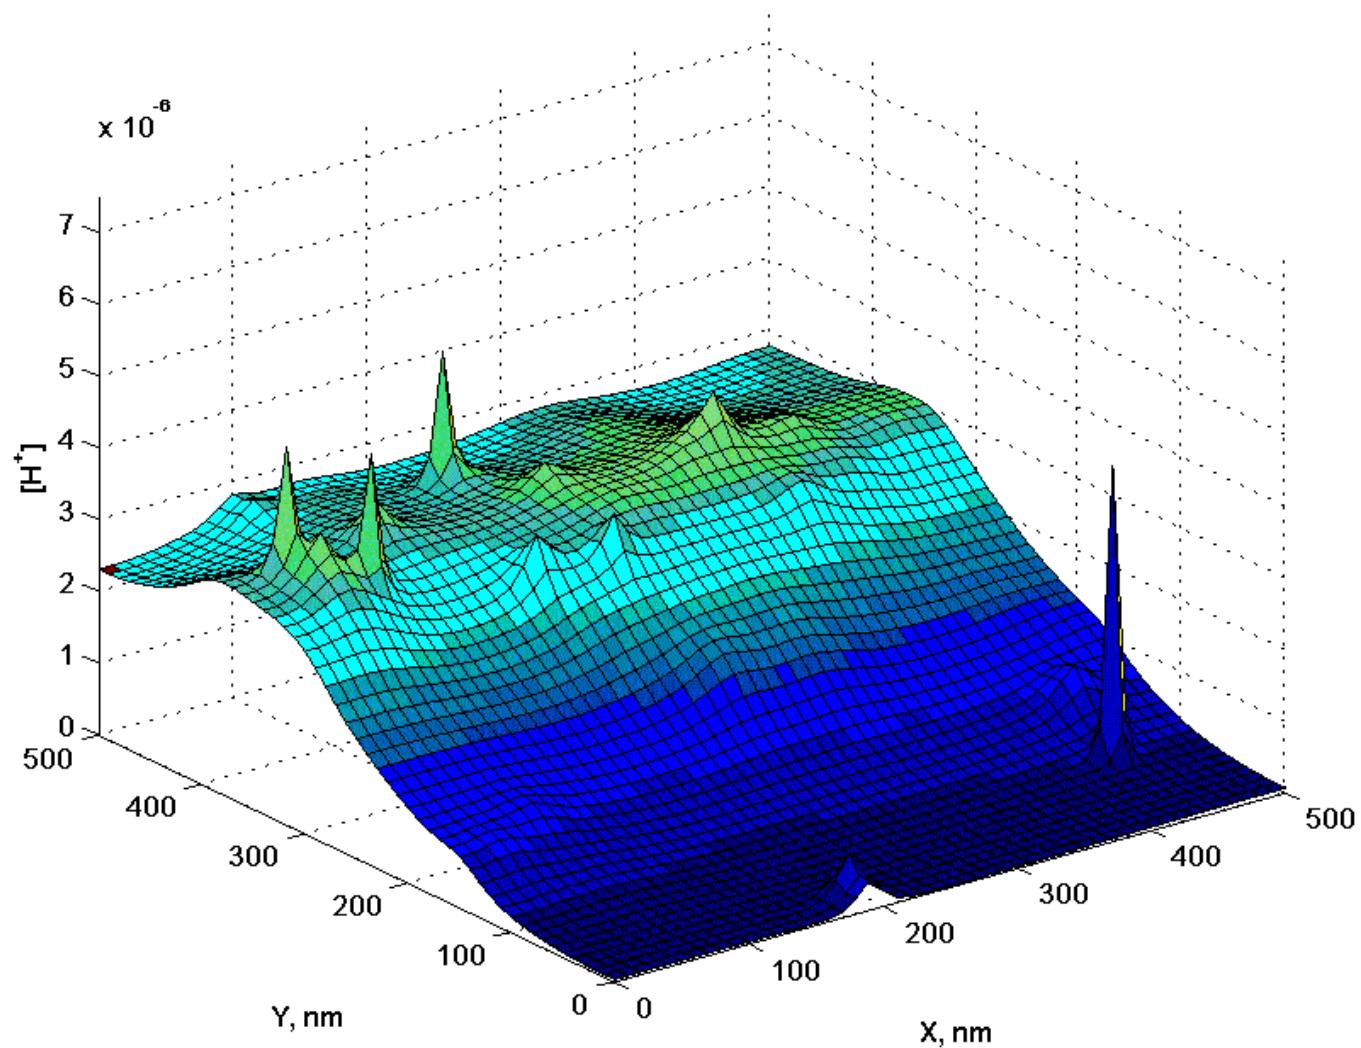

- Концентрация протонов в плоскости мембранны, через 5 миллисекунд после начала освещения

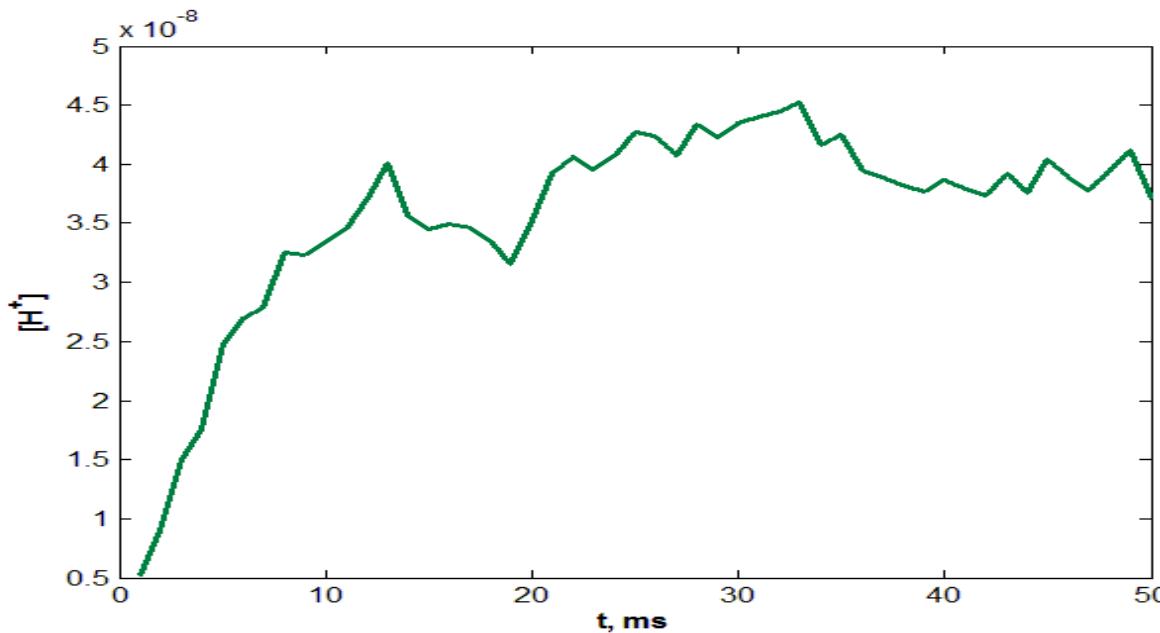

## Профиль концентрации протонов в люмене в плоскости мембраны

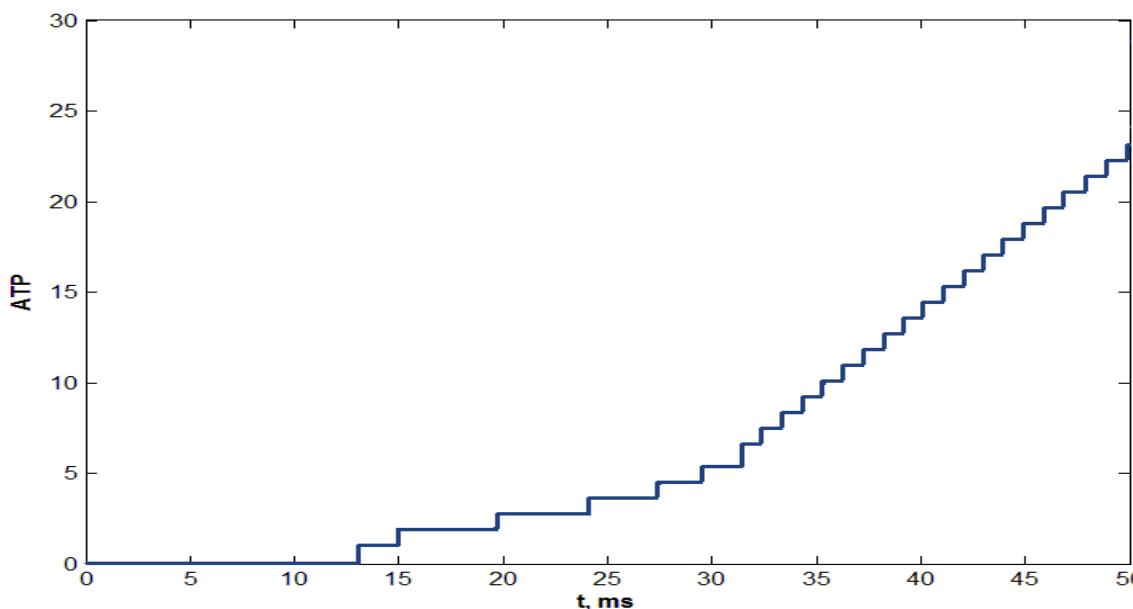

## Профиль концентрации протонов в люмене в плоскости мембраны

## Концентрация протонов в люмене и синтез АТФ

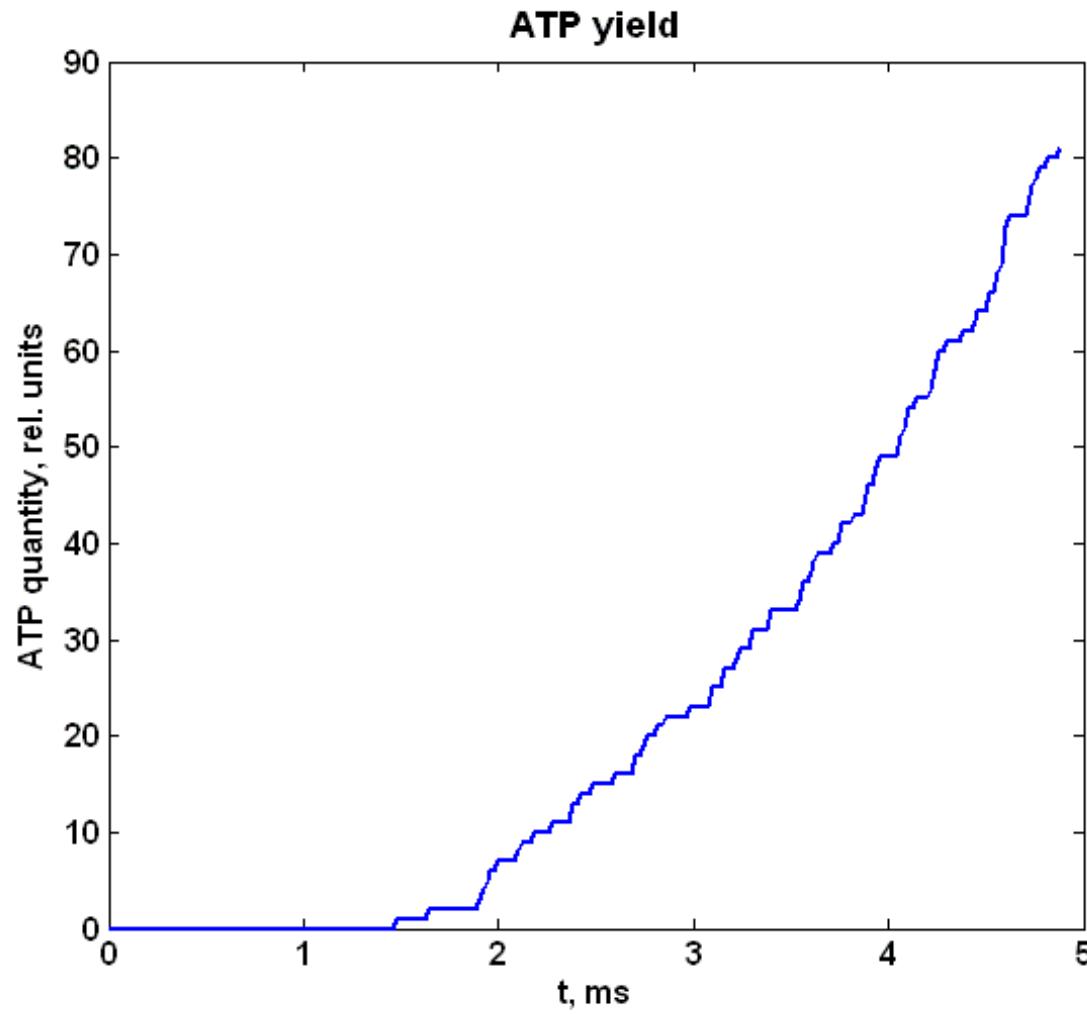

Общее количество протонов в люмене сначала нарастает, и со временем и выходит на постоянный уровень

С ростом  $\text{pH}$  в стромальной области АТФ-синтаза начинает производить АТФ. Сначала скорость синтеза лимитируется количеством доступных протонов, затем – временем поворота субъединиц.

# Синтез АТФ

- Количество синтезированной АТФ в зависимости от времени
